

The Aerne Analytic Series Baths for explosion-proof areas are used for extraction or distillation with ether or other inflammable mediums. The heating occurs indirectly by a circulator which is positioned outside of the danger area. The Series Baths are equipped with openings for round or flat-bottomed

flasks with removable caps, support rods, clamps and a control dial thermometer. The revolving baths are utilised for the heating of external containers or baths in laboratories. Revolving baths can be produced in different sizes and custom specifications.
